# Xlth Accident Compensation Seminar 

## Game Theory and Australia's CTP Markets

## Bill Konstantinidis

 Richard Mayo Colin Priest
## Introduction

- Actuarial pricing
- Characteristics of this market
- Game theory
- Some scenarios
- Conclusions

## Actuarial Pricing

- Considers:

| Frequency | Claim Size |
| :--- | :--- |
| Expenses | Capital |
| Profit Margin | Investment Income |
| Cash Flows | Systemic Change |

- Considers less, or does not consider:

| Competitor Pricing | Competitors’ Reactions |
| :--- | :--- |
| Competitor Strategy | Our strategy |
| Market cycles | Short vs Long Term tactics |

## Game Theory: Dominance

Sture of coureses tuinminiat Xth Accident Compensation Seminar

## Game Theory: Dominance

## Game Theory: Choice of Strategy

- You cannot ignore interactions between you and your competitor
- Your optimal strategy is determined by your bargaining power
- Your bargaining power is determined by how you can affect your competitor's payoffs

## Game Theory: Sharing the Benefits

- Consider a situation in which three distribution channels are considering merging in order to save on fixed expenses
- How should the lower, shared fixed expenses be shared between them?
- Many actuaries allocate fixed expenses in proportion to premiums
Distribution

Channel Premium \begin{tabular}{c}
Old <br>
Fixed <br>
Expenses

 

Allocated <br>
by <br>
Premium

 

New Fixed Expenses <br>
Shapely <br>
Value
\end{tabular}

## Game Theory: Sharing the Benefits

- We need an allocation that:
- Totals to the correct amount
- Gives everyone a benefit from the expense savings (i.e. everyone is better off)
- Rewards those who contribute the most savings to the coalition

## Scenarios

| Starting Position |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Two insurers | A |  |  | B |  |  |
| 2 categories of policyholders |  |  |  |  |  |  |
|  | Policy Count | Price | E(Claims) | Policy Count | Price | E(Claims) |
| Best | 800 | \$320 | \$224 | 600 | \$320 | \$224 |
| Worst | 200 | \$500 | \$350 | 400 | \$500 | \$350 |
| Total GWP / GIC | 1,000 | \$356,000 | \$249,200 | 1,000 | \$392,000 | \$274,400 |
| Loss Ratio |  |  | 70.0\% |  |  | 70.0\% |
| Expenses Fixed |  | 15\% | \$53,400 |  | 15\% | \$58,800 |
| Variable |  | 10\% | \$35,600 |  | 10\% | \$39,200 |
| Profit |  |  | \$17,800 |  |  | \$19,600 |
| Capital |  | 50\% | \$178,000 |  | 50\% | \$196,000 |
| ROE |  |  | 10\% |  |  | 10\% |

## Scenario 1: Aggressive Competitor

- Starting from equilibrium, what happens if one insurer changes its rates?
- Tests different changes and different reactions

## Scenario 2: Soft Market

- Moving up to a technically sound premium can damage your profitability!
- The only way out is to co-operate, but many forms of co-operation are illegal under the Trade Practices Act
- Otherwise you are stuck playing "chicken" with your competitors

## Xlin Accident Compensation Seminar

## Conclusions

- There is more to actuarial pricing than working out the risk
- Actions of competitors can be more important that the technical price as competitor action can affect risk mix and expected volumes and thus coverage of fixed costs
- Following the market down is not necessarily a bad thing
- In a market with increasing competition consideration of your competitors' strategies is paramount. The winner is the one who out thinks his competitor.
